

Amendment to the Specification. Please replace the following paragraphs to the specification.

At page 18, paragraph 2:

5 Block 10 contains a power supply 100 for low water cut-off system A. It comprises a transformer T1 and bridge circuit (diodes D1 and D3) to convert either 120VAC or 24VAC to 12VDC, which is then down-regulated to provide a 5VDC output for supplying these electronic circuits.

10

At page 21, paragraph 1:

15 Networks 122A and 122B are mutually cooperative, providing a functional effect of logic AND gating to ensure that if there is sufficient vessel level of water, as accommodated according to its purity by adjustment of pentiometer R1, both transistors Q1 and Q2 are normally driven to a conductive state. The series collector-emitter circuits provided by Q1 and Q2 is supplied with voltage from the power supply 110 through a diode B16. When transistors Q1 and Q2 both are in their conductive state,
20 relay K1 becomes energized and enabled which is representative of a normal water level in the boiler. If water is not present, i.e. a low water condition exists, Q1 and Q2 are cutoff and become non-conducting, thus de-energizing K1 which indicates a low water condition.
